 - Pulse
 - Oxidation
 - Glucose
 - Weight
 - Temperature
 - Steps/Exercise
 - Sleep Quality
 - Calories burned
- Electronic Medical Records System with open API to exchange data with the existing EMRs

Select only what you need!

Patient, Nurse and Physician Friendly!

→ Clinical Benefits

- **Enhanced Access to Healthcare** - Virtual care can bridge the gap in healthcare access for individuals in remote or underserved areas, allowing them to receive medical consultations and advice without needing to travel long distances.
- **Public Health Management** - Virtual care can aid in monitoring and managing public health issues, such as outbreaks and pandemics.
- **Emergency Response** - During emergencies or natural disasters, virtual care can serve as a valuable tool for triage, initial assessment, and providing medical advice to individuals in affected areas.

→ Financial Benefits

- **Reduced Healthcare Costs** - By offering virtual care options, governments can potentially reduce healthcare costs associated with in-person visits, such as facility maintenance, staff salaries, and administrative overhead.
- **Efficient Resource Allocation** - Governments can optimize healthcare resources by utilizing virtual care for routine and non-urgent medical consultations, thereby freeing up in-person appointments and resources for more critical cases.
